Polygon and Cloud Tool

⬜ - Polygon (**Shift-P**) and   ⬜ - Cloud (**C**) Tools

The Polygon and Cloud annotations are very similar. The Cloud is essentially a Polygon annotation with a cloud-like appearance preset for Line Style. For this reason the behavior of the Polygon tool and Cloud tool is the same.

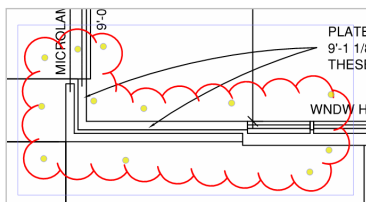

Create one of these annotations by clicking the left mouse on the PDF and drawing the path that you to make by repeatedly clicking on the PDF at various points.

As you draw the path, you will see a black line representing the polygon shape. Make the final point close to the origin point to close the polygon or cloud.

Alternatively you can use three other means for closing the polygon: 1) double-click the left mouse button; 2) press the **Enter** key; or 3) press the **C** key. Once completed, the annotation and the handles will be displayed so that you can reposition or resize the Polygon or Cloud.

A more complex example of a path is shown to the right. Each one of the yellow handles can be individually grabbed to make fine adjustments to the position and shape of the cloud or polygon.

The appearance of the Polygon/Cloud can be modified as follows:

Color - Sets the outline color for the polygon/cloud.

Fill Color - Determines the interior color of the polygon/cloud.

Opacity – Controls the level of transparency (100% is opaque).

Line Width - Sets the thickness of the border or cloud in points.

Style – Determines the line type used to define the polygon/cloud. See Rectangle and Ellipse Tool for more details on Style options.
